

# *Modeling Liquid Surfaces*

---

D. Buchenauer and R. Bastasz

*Sandia National Laboratories*

W. Eckstein

*Max-Plank-Institut für Plasmaphysik*

- **Motivation**
- **Approach**
- **Preliminary results**

# *Surface-induced ordering of liquid surfaces*

- Predictions have been known since the late 70's and 80's
- Advances in synchrotron sources in last 10 years have allowed measurements to be made of the near surface
  - ↗ High accuracy positioning
  - ↗ Spectrally pure beam
  - ↗ In-situ oxide removal
  - ↗ Capillary effects accounted for
- Observations from many systems imply that surface ordering is a general result for liquid surfaces
- The effect of surface density stratification and coordination number need to be introduced into sputtering calculations for liquid metals

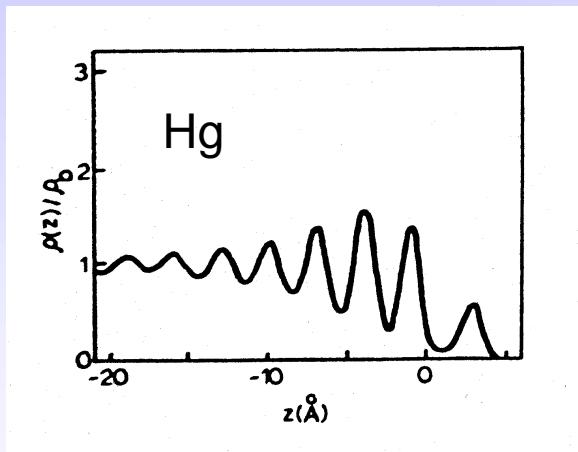

**Review article**

J. Penfold, Rep. Prog. Phys. 64 (2001) 777.

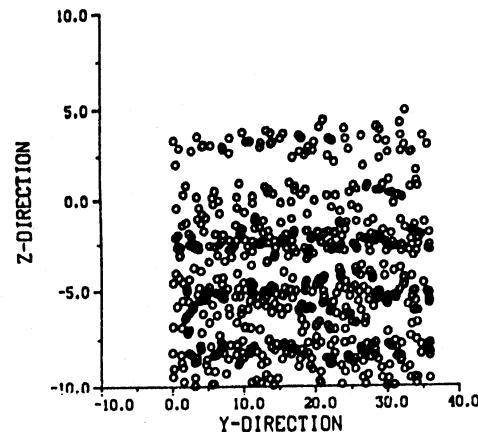

# *Early liquid surface models showed effect on self sputtering yield*

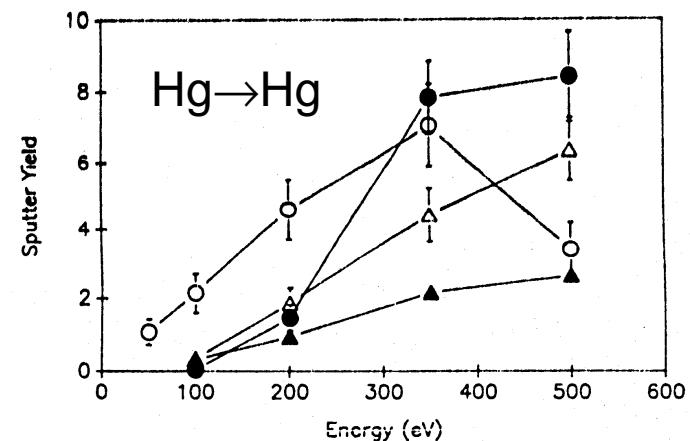

- Stratified layer predicted by D'Evelyn and Rice (1982)

M. P. D'Evelyn and  
S. A. Rice,  
J. Chem. Phys. 78  
(1983) 5081.

- Sputtering calculations using MD calculation and model density from above were performed by Morgan (1988)

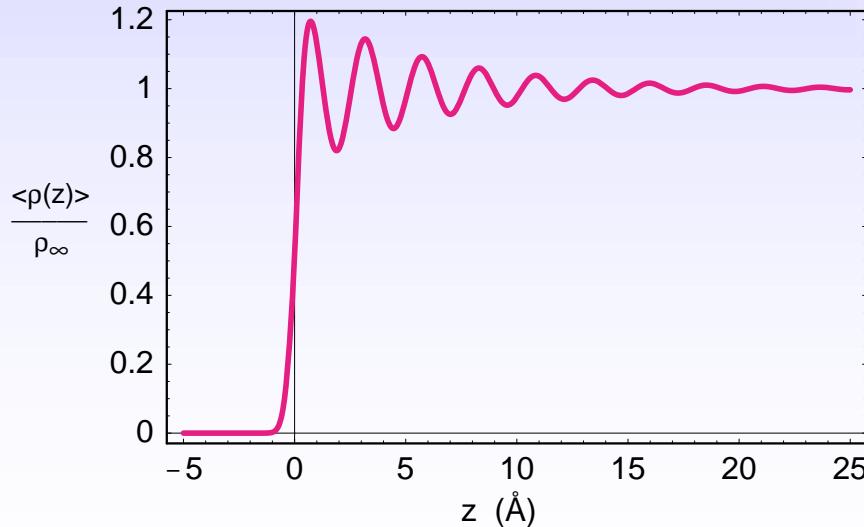

W. L. Morgan, J. Appl. Phys. 65 (1989) 1265.

# *Model for stratified density fit to X-ray diffraction data of liquids*

- Most recent experimental data for liquid metals is for Ga
- Surface density model includes layering and capillary wave broadening
- No lithium data or models

$$\frac{\langle \rho(z) \rangle}{\rho(\infty)} = \operatorname{erf} \left[ \frac{z-z_0}{\sigma} \right] + \theta(z) A \sin \left( \frac{2\pi z}{d} \right) e^{-z/\zeta}$$

$$z_0 = 0$$

$$\sigma = 0.5 \text{ \AA}$$

$$A = 0.5$$

$$d = 2.56 \text{ \AA}$$

$$\zeta = 5.8 \text{ \AA}$$

M. J. Regan, et. al., Phys. Rev. Lett. 75 (1995) 2498.

# *Liquid sputtering model development*

---

- Use model liquid surface density function from literature
- Use Monte Carlo TRIM code (TRVMC98) for calculating incident and recoil trajectories and calculating collision cascade
  - ↗ Layer densities are stationary
  - ↗ Multilayer capable (present limit of 3 layers)
  - ↗ Compiled from source code
  - ↗ Vary layer density (and later surface binding energies)
  - ↗ Incorporate additional physics
- Unix Workstation (Sparc Ultra 10)
  - ↗ 6 x 6 matrix of results requires 5 - 8 hours

# *Progress to date*

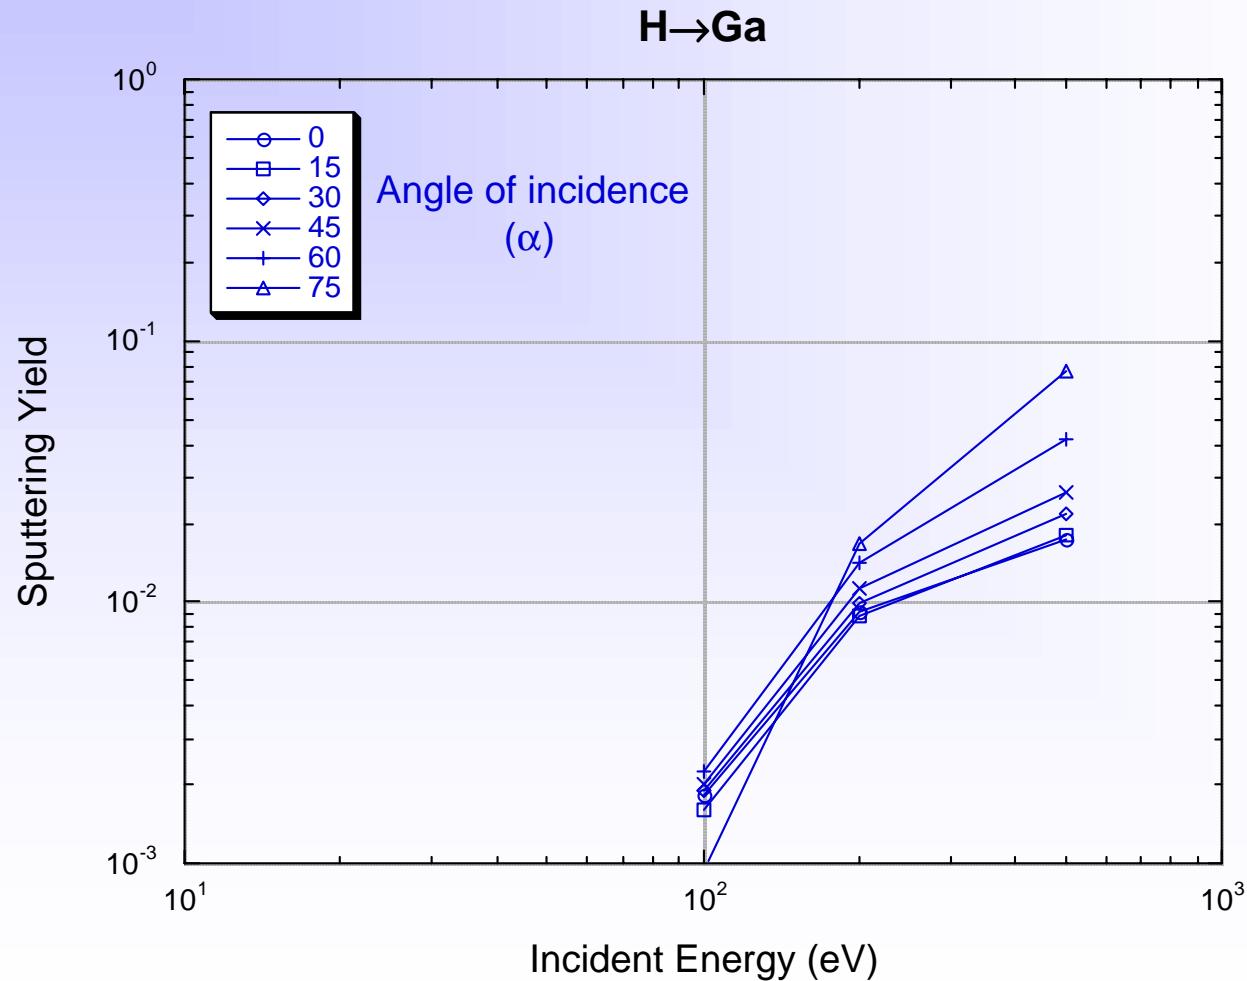

## ■ Initial calculations

- ↗ Validate multi-layer code results with previous TRIM calculations (Eckstein's survey from 1993)
- ↗ Initial look at effect of one period of the surface layer structure (on semi-infinite bulk density)

QuickTime™ and a  
None decompressor  
are needed to see this picture.

# Conclusions

---

- Surface density layering can result in increases in the sputtering yield
- Density effect appears to be largest in the case of self-sputtering
- Further development is needed to accurately model surface layering and incorporate coordination number effects
  - ↗ Add additional layers to TRIM98
  - ↗ Vary surface binding energies
  - ↗ Improve statistics at low sputtering yields
  - ↗ Look at H recombination energy in thin layers
